## Complimentary Reference Material

This PDF has been made available as a complimentary service for you to assist in evaluating this model for your testing requirements.

TMG offers a wide range of test equipment solutions, from renting short to long term, buying refurbished and purchasing new. Financing options, such as Financial Rental, and Leasing are also available on application.

TMG will assist if you are unsure whether this model will suit your requirements.

Call TMG if you need to organise repair and/or calibrate your unit.

If you click on the “Click-to-Call” logo below, you can call us for FREE!

## Modulation Analyzer R&S® FMB

The specialist for sound broadcast signals from 50 kHz to 1360 MHz

- ◆ Built-in precision stereo decoder both for internal FM stereo decoding and for decoding of an external stereo multiplex signal
- ◆ External stereo decoder input
- ◆ Demodulation of RDS and traffic program signals
- ◆ ITU-R detector and standard weighted/unweighted ITU-R filters
- ◆ Distortion meter from 10 Hz to 100 kHz
- ◆ RF frequency measurement with 10-digit readout, maximum resolution 0.1 Hz
- ◆ High-precision AM, FM and  $\phi$ M measurement over a wide modulation frequency range
- ◆ Complete AF analysis in the L, R, M and S channels including distortion measurement and S/N ratio measurement to ITU-R standard
- ◆ Selective measurement of pilot tone deviation and deviation of 57 kHz traffic program carrier
- ◆ Built-in RDS demodulator with clock and data output for external decoding
- ◆ Measurement of modulation depth of 57 kHz traffic program carrier
- ◆ High-accuracy power measurement (typ. error <0.5 dB)

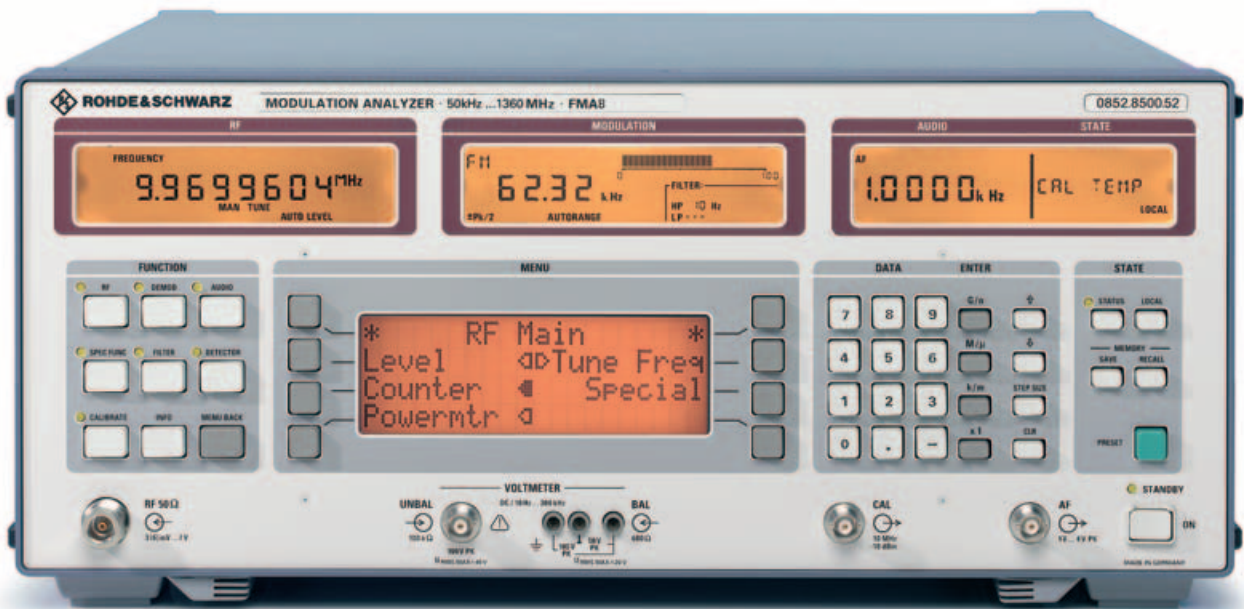

**ROHDE & SCHWARZ**

The Modulation Analyzer R&S®FMAB has been especially designed for the analysis of FM stereo broadcast signals. It combines the universal features of the R&S®FMA basic model and the additional measurement capabilities of the built-in stereo decoder.

The measurement tasks of the R&S®FMAB mainly cover the field of sound broadcasting and include comprehensive analysis of VHF transmitters, channel transposers and VHF/baseband converters. Since the stereo decoder with all its analysis functions can be

separately used via the rear-panel input, measurements on FM receivers and stereo coders are also possible.

Three large illuminated LCD displays simultaneously read out the measured carrier frequency, modulation and modulation frequency, plus additional information about device status and settings. The clear front-panel layout, with softkeys and a few main function keys, makes for user-friendly operation. Previously complex measurements on FM stereo signals thus become very simple.

Front view of R&S®FMAB

*All essential test parameters can be read at a glance on clearly arranged LCD displays*

## Characteristics

Owing to the clear layout of the R&S®FMAB, all essential test parameters can be read at a glance on the LCD displays. Superimposed additional information, such as the test channel, deemphasis switched on, affords high measurement reliability.

### Precision stereo decoder

The precision stereo decoder has been especially designed for wide dynamic range and flat amplitude and phase response that are required in FM stereo measurements. The weighted stereo S/N ratio of  $\geq 80$  dB and the channel crosstalk attenuation of  $\geq 60$  dB in the range 30 Hz to 15 kHz are top-class.

The special characteristics of the built-in FM demodulator regarding frequency and phase response as well as low distortion are ideally matched to the stereo decoder. The values achieved meet the relevant specifications of broadcasting corporations and are even better in many cases.

### Dynamic range

An extremely low-noise local oscillator (typ.  $-130$  dBc at 1 GHz, 20 kHz carrier offset) ensures a sufficient S/N ratio for FM stereo decoding even far above the VHF band, e.g. for measurements on channel transposers in the UHF range. A weighted FM stereo S/N ratio of typically 78 dB for carrier frequencies up to 170 MHz allows precise S/N ratio measurements on FM broadcast transmitters, channel transposers and VHF/baseband converters.

### Result display

Frequency or level, deviation or modulation depth as well as frequency or distortion are read out independently of one another on three LCD displays. All essential device settings, such as operating

mode, test channel, type of detector, weighting filter, are superimposed on the relevant display.

A scaled bargraph indicator with a high resolution (one hundred divisions) is provided especially for the alignment of DUTs followed by modulation and voltage measurements.

When relative measurement (% or dB) is selected, the bargraph indicator automatically switches to plus/minus indication in the measurement of small deviations. This ensures fast and easy adjustment to a defined reference value.

A special min/max hold mode allows simultaneous analog display of the current result and the defined minimum and maximum values.

*The analog bargraph indicator is ideally suited for adjustments, e.g. to a defined reference value*

## Operation

Due to its versatile measurement functions, the R&S®FMAB is menu-controlled so that there is no need for a great number of individual keys.

The minimal number of main function keys as well as an alphanumeric menu display with four softkeys arranged at both sides make for clear front-panel layout and fast access to the desired measurement functions. Important functions are at a high menu level, the number of submenu levels being limited to a maximum of three so that finding one's way in the menu is easy.

Parameters, like for instance a reference value for relative display, can be entered via the numeric keypad and are terminated with one of the ENTER keys (unit/multiplier keys). The fact that up to 20 complete setups can be stored considerably enhances the measurement reliability in complex applications.

## Remote control

The Modulation Analyzer R&S®FMAB features full remote-control capability. The FM stereo measurement facilities are system-compatible. The IEC/IEEE bus interface fully complies with the IEEE 488.2 standard and enables plain-text programming, which greatly facilitates program writing. For setting an FM deemphasis of 50  $\mu$ s, for instance, with FM stereo decoding switched on, the following entry is made:

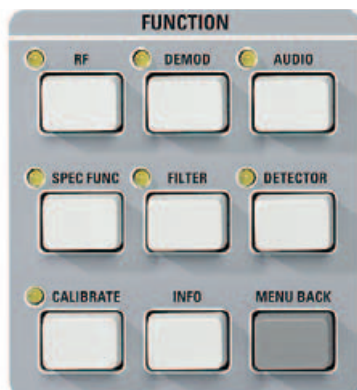

STEREODECODER:DEEMPHASIS 50 US

## Measurement functions

The R&S®FMAB features standard measurement functions in modulation analysis and a wide variety of additional capabilities owing to the built-in stereo decoder:

- ◆ Fast, fully automatic ranging to input frequencies from 50 kHz to 1360 MHz at levels from 3 mV to 7 V
- ◆ RF frequency measurement with 10-digit readout and resolution down to 0.1 Hz
- ◆ AM modulation depth, FM and  $\phi$ M deviation with error of less than 0.5%, wide dynamic range and 3 dB bandwidth of >300 kHz; FM and  $\phi$ M deviation measurement range 700 kHz (rad); AM, FM and  $\phi$ M demodulation from 50 kHz carrier frequency upwards
- ◆ Audio frequency measurements with 5-digit readout and resolution down to 1 mHz
- ◆ Distortion and SINAD measurement continuously from 10 Hz to 100 kHz with a dynamic range of >80 dB
- ◆ Psophometric weighting filters
  - Highpass filters 10/20/300 Hz
  - Lowpass filters 3/23/100 kHz
  - ITU-R filters (468-4) weighted and unweighted
  - ITU-T and other special weighting filters

*The few main function keys make the R&S®FMAB user-friendly:*

<b>RF</b>	All RF settings such as tuning frequency, input level and RF frequency counter
<b>DEMOD</b>	Selecting the demodulation modes and access to the FM stereo decoder functions
<b>AUDIO</b>	Setting the audio frequency counter or the DIST/SINAD meter
<b>SPEC FUNC</b>	Special functions such as voltmeter mode, IEC/IEEE bus address, bargraph indicator control, etc
<b>FILTER</b>	Selecting the audio filters
<b>DETECTOR</b>	Selecting the detector for the modulation display
<b>CALIBRATE</b>	Calibrating functions
<b>INFO</b>	Readout of all internal settings on the menu display
<b>MENU BACK</b>	Going back a level in the menu tree

*Softkeys enable fast access to desired measurement functions*

- ◆ Precision detectors: separate +PK and –PK detector with extremely short response time, MAX PEAK function; true RMS detector; quasi-peak detector to ITU-R 468-4
- ◆ AC and DC voltage measurements
- ◆ Power measurement (error typ.  $\leq 0.5$  dB, overload protection circuit for up to 5 W input power)

## Options

The R&S®FMAB can be expanded by the optional highly stable 10 MHz Reference Oscillator R&S®FMA-B10 with aging of  $<1 \times 10^{-9}$ /day. The frequency measurement error at 100 MHz of maximally 200 Hz is thus reduced down to 10 Hz within a calibration interval of one year.

The AM/FM Calibrator R&S®FMA-B4 including an AF generator from 10 Hz to 100 kHz with two external, separately switchable outputs is also available as an option. The error of the calibration source is less than 0.1%.

The 5.2 GHz Frequency Extension R&S®FMA-B12 is provided for special applications at higher frequencies, e.g. outside-broadcast links in the GHz range.

## Applications

A phase-compensated noise suppression filter with a bandwidth of 95 kHz ( $-3$  dB) can be switched into circuit between FM demodulator and stereo decoder especially for internal stereo decoding. High-frequency spurious components can thus be efficiently kept away from the stereo decoder, with negligible effect on the phase linearity and channel crosstalk from L to R and R to L. In conjunction with the option R&S®FMA-B4 (calibrator and audio generator), the R&S®FMAB can be expanded to form a complete test set especially for FM broadcast transmitters. All quality-relevant parameters of VHF sound broadcast transmitters can thus be measured without the need for any additional measuring instruments.

Separate +PK and –PK detectors featuring very short response time and high precision are ideally suited for simultaneous detection of positive and negative peak deviation of FM stereo program signals. In conjunction with the PK HOLD function, peak deviations can be monitored for periods ranging from very short to a duration of any length. If the MAX PEAK function is selected on the R&S®FMAB, the maximum deviation will be indicated on the display.

## Peak deviation monitoring

In conjunction with a process controller, e.g. the R&S®PSA, the R&S®FMAB is ideal for monitoring the peak deviation of VHF broadcast transmitters. In the PK HOLD mode, +PK and –PK detectors operating in parallel and featuring a very short response time ensure precise measurement of all, even the narrowest of modulation peaks. The monitoring intervals can be from  $\leq 100$  ms up to any duration. The values measured by all detectors such as +PK, –PK, RMS and quasi-peak can be read out per unit time.

Rear view of the R&S®FMAB

The R&S®FMAB is designed for high measurement speed:

- ◆ Fast, automatic frequency adjustment by direct frequency measurement up to 1.36 GHz
- ◆ Correct frequency measurement even at large AM depth due to state-of-the-art technologies
- ◆ Two independent frequency counters for simultaneous RF and AF measurement

- ◆ All measurement times can be adapted to the specific measurement problem, e.g. lowest measurement frequency or required counter resolution

Measurement functions that are not required can be switched off, e.g. for extremely fast modulation measurement with preset RF level and preset RF frequency. In this way, 10 modulation values can be measured per second.

### Future-oriented design

The frequency range can be extended up to 5.2 GHz, thus allowing measurements on special broadcasting and program distribution systems. The built-in firmware can easily be updated via a serial interface using a PC compatible with the industry standard.

*Frequency response in L channel;  
Selected components ensure minimum frequency response and high spurious suppression in the L, R, M, S channels*

*Frequency response of pilot filter;  
A high-selectivity pilot tone filter allows unimpaired measurement of the pilot tone deviation; the phase error of the pilot tone filter can be automatically eliminated with the aid of a method specially developed by Rohde & Schwarz; new standards are thus set in the measurement of stereo channel crosstalk*

## Specifications

Frequency	
Frequency range	50 kHz to 1360 MHz
Frequency tuning	automatic <sup>1)</sup> or manual
Display	10-digit readout
Resolution	0.1/1/10/100 Hz selectable
Frequency error and drift	±1 digit + error of reference frequency
Reference oscillator	<b>standard</b> <b>option R&amp;S® FMA-B10</b>
Aging	2 x 10 <sup>-6</sup> /year    1 x 10 <sup>-7</sup> /year
After 30 days of operation	—    1 x 10 <sup>-9</sup> /day
Temperature effect	2.5 x 10 <sup>-6</sup> 2 x 10 <sup>-9</sup> /°C (0°C to 55°C)
Warmup time	15 min    15 min
External reference input/output	manual or remote-controlled switch-over
Output level	12 dBm ±2 dB
Input level range	-10 dBm to +15 dBm
RF input	Z <sub>in</sub> = 50 Ω, N connector, VSWR <1.4 with 10 dB attenuation
Overload protection	up to 5 W (15 V RMS)
Maximum peak voltage	25 V (including DC)
RF power measurement	
Frequency range	50 kHz to 1360 MHz
Power measurement range	0.18 μW to 1 W (-37.5 dBm to +30 dBm)
Measurement error	
0.18 μW ≤ P < 0.1 mW	≤±1.5 dB ±0.05 μW
P ≥ 0.1 mW	≤1 dB (typ. 0.5 dB)
Amplitude modulation measurement	
Modulation frequency range	10 Hz to 200 kHz
Resolution	0.1% of reading; max. 0.001% AM
Measurement error <sup>2)</sup> with peak detection (% of reading, plus peak residual AM)	
$f_{in}$	50 to 300 kHz    >300 kHz to 10 MHz    ≥10 MHz <b>measurement error</b>
