PS-33 Level Generator

for the frequency range 200 (50) Hz to 1.62 MHz

- Synthesizer for high frequency accuracy
- Frequency and level setting via keyboard or stepwise
- Digital frequency and level displays
- Output level adjustable in 0.1 dB steps
- Level display in dB/dB0 or dBm/dBm0 or in mV
- Coaxial and balanced outputs
- Output impedances of approx. 0; 50, 75, 150, 600 Ω
- Memory for 100 setups/fixed frequencies
- Battery or a.c. powered (external adapter/charger)
- Compact, lightweight and easy to operate
- Optional case for instrument and accessories

Applications

The compact and handy-sized PS-33 Level Generator provides a signal source for measurements on balanced and coaxial FDM transmission systems and for measurements at the base-band frequency level of radio-link and satellite systems with up to 300 channels. The lower frequency range limit also enables VF and AF ranges to be detected. The PS-33 Level Generator can also be used at 50 Hz. Because it is battery-operated and is unaffected by large temperature changes it is ideal for field operation. It can be used for in-service maintenance on communication systems as used by PTTs, railways and public utility companies in the energy sector. It can be operated in conjunction with the SPM-32, SPM-33 or SPM-34 Selective Level Meters to give a complete measuring setup, which is especially suitable for carrying out end-to-end measurements where different send and receive frequencies may be required. When the level generator is operated together with W&G measuring bridges, analog measurements on ISDN equipment can also be performed.

Characteristics

The PS-33 Level Generator stands out for its variety of functions and ease of operation. The use of large-scale integration (LSI) and surface mounted devices (SMD) has reduced the size and weight to a fraction of that of a conventional level generator.

| | |
|--|---|
| Frequency range | 200 (50) Hz to 1.62 MHz |
| Frequency error limits | $\pm 3 \cdot 10^{-6} \pm 1$ Hz |
| Output level range (dependent on impedance) | |
| when matched | -60 to +15 dBm |
| Output impedance, coaxial | approx. 0 Ω ; 50 Ω ; 75 Ω |
| balanced | approx. 0 Ω ; 75, 150 ^{*)} , 600 Ω |
| | ^{*)} 124, 135 or 140 Ω as an option |
| Harmonic ratio, $f \geq 200$ Hz | ≥ 50 dB |
| Operating error, $Z_{out} = Z_0 = 75 \Omega$, coaxial | |
| $f = 0.2$ to 620 kHz/1.62 MHz | $\pm 0.22/\pm 0.3$ dB |
| Ambient temperature, operating range | 0 to +50°C |
| Recommended level meter | SPM-32, SPM-33, SPM-34 |

The send frequency is produced by a synthesizer and so has high accuracy and stability. Both frequency and level can be set via the numerical keypad, in steps or in quasi-analog mode, and can be read off very accurately from the display.

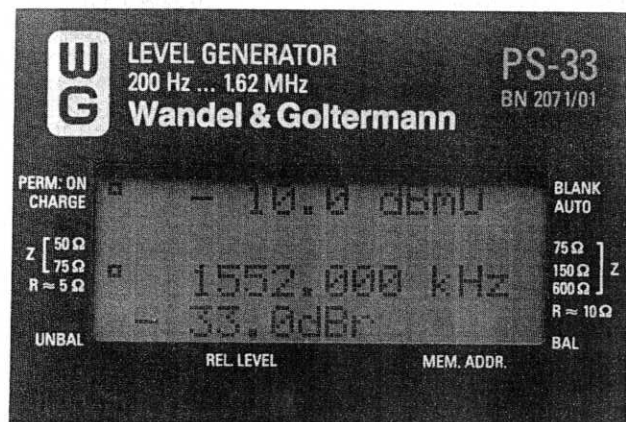

100 instrument setups and fixed frequencies can be stored in the memory to facilitate frequently performed measurements.

Battery operation is possible. The battery voltage is monitored to ensure that incorrect measurements cannot be made. For longer measurements the PS-33 Level Generator can be connected to an a.c. line adapter/charger unit.

After switching on a self-test is performed and any errors are indicated in the display.

Further Characteristics and Applications

- Soft blanking of the output level: prevents unwanted frequencies occurring when changing frequency which could cause interference in transmission systems.
- Level and frequency range limits can be set to the user's requirements. The risk of causing system interference due to an incorrect setting (e.g. feeding in too high a level or the wrong frequency) is therefore greatly reduced.
- Voltage display and 50 Ω output: the PS-33 is also suitable for laboratory work as the signal source is accurate, stable and of high spectral purity and output impedance of 50 Ω and approximately 0 Ω are available.
- ISDN measurements: the PS-33 can be operated in conjunction with the SPM-33 (32) Selective Level Meter and the ISDN measuring bridges ISM-1 and IMB-1 (see separate data sheets) to form a handy measuring setup. It can be used to measure line and crosstalk attenuation on the transmission circuit as well as signal balance ratio and impedance on terminal equipment (TE) and network termination (NT). All the equipment can be accommodated in the ISDN MK-4 equipment case (BN 2092/04).

General specification

Power supply

Battery or A.C. line operation

Dry batteries (fitted) 2×9 V IEC 6 LF 22
 Option NiCd batteries (2 reqd.) . . . e.g. Varta TR 7/8 No. 5022
 or Sanyo N-6 PT

Separate a.c. adapter/charger for recharging NiCd batteries.
 It is possible to charge the batteries and make measurements
 at the same time.

Operating time

(dependent on output level, ambient temperature, operating mode
 and type of battery)

with dry batteries approx. 7 hours

with NiCd batteries approx. 2 hours

Auto off when batteries low; prevents deep discharging and
 incorrect results.

Ambient temperature

Operating range 0 to +50°C

Limits operating range -10 to +55°C

Storage and transport -40 to +70°C

Size (in mm) 110×200×60

Weight with batteries approx. 1 kg
