GIGAZoom Function for Instantaneous Full-Length Display of 1 GW of Data

A large-scale, high speed ASIC was created to give the DL750 the ability to show the entire 1 GW of data on the display in real time

Two zoom windows are available for displaying up to 500 MW of data. Zooming can be done in real-time or after data recording has stopped.

1 GW memory for full-length display and instantaneous zooming (to user-specified size)

DualCapture: A Powerful Tool for Durability Test Data Analysis

Simultaneous High-Speed and Low-Speed Recording Using DualCapture

During durability testing, it is necessary to monitor the long-term trends of your data as well as capture the high speed transients that might occur. This presents a challenge as trend data is usually recorded at a slower sampling speed that might miss the transient phenomena. To meet this challenge, the DL750 offers the DualCapture function.

Using DualCapture, you can now record your trend data with a slow sampling speed and still be able to capture the transient phenomena with a faster sampling speed.

■ Integration of a High-Speed Sampler (Oscilloscope) and Low-Speed Sampler (Recorder) in a Single Unit

High-speed sampler: Trigger on abnormal high-speed phenomena
Low-speed sampler: Roll recording (trend recording)

■ Separate Memory Management for Each Sampler

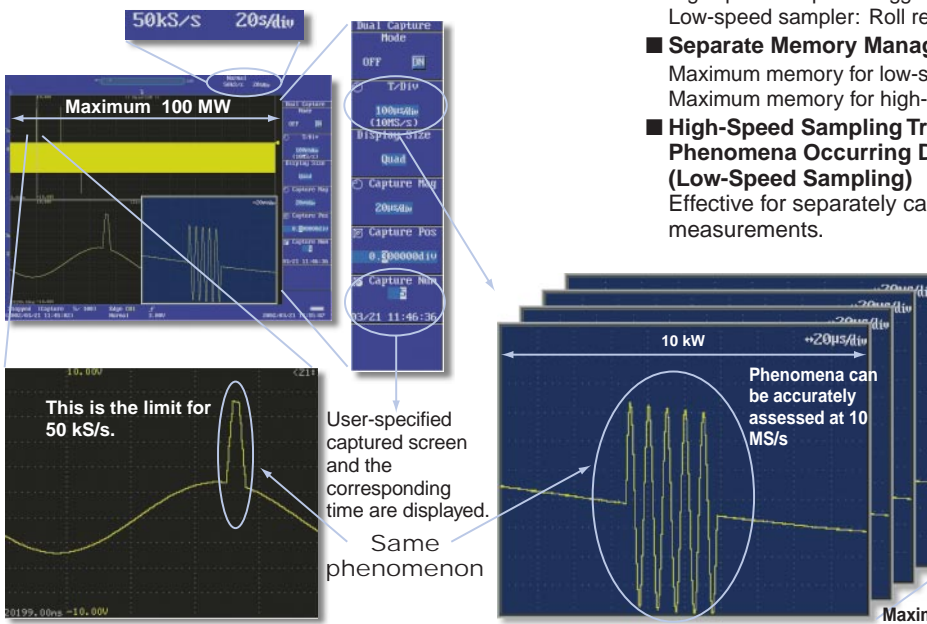

Maximum memory for low-speed sampler: 100 MW
Maximum memory for high-speed sampler: 10 kW × 100 screens

■ High-Speed Sampling Triggered Only by Abnormal Phenomena Occurring During Long-Term Observation (Low-Speed Sampling)

Effective for separately capturing data at high speed during measurements.

■ Long Memory Equivalent to 1 Teraword

To acquire many hours of data at the higher sampling rate (10 MS/s) would require Terawords of memory
(8 hr-240 hr) × 60 min × 60 sec × 10 MS/s × 16 channels
= 4.6-138 TW

The waveform shown above was captured at a sampling rate of 50 kS/s. The occurrence of noise can be confirmed in the graph, but the time resolution is too low to capture the waveform accurately.

With DualCapture, the user sets triggers for capturing sudden phenomena. Up to 100 phenomena can be collected in a memory length of 10 kW at a maximum sampling rate of 10 MS/s.

Voice Memo Function: Save Audio Comments along with Waveform Data and Images

NEW VOICE MEMO

Enables You to Record and Playback 2 Types of Voice Data

■ Voice Memo

Simply press a switch to record your voice while simultaneously recording waveforms. Make multiple recordings per waveform (100 seconds total, min. 3 seconds per recording).

■ Voice Comment

Record and save an explanatory comment (approx. 3-10 seconds) together with your image files.

The 701951 Earphone-Mic (with PUSH switch) is required to record voice memos and to listen to recorded voice memos.

Accurately Measure and Display Complex Signals

Capturing Signals Using the Longest Memory Capacity Ever

For Accurately Capturing Complex Signals or Long Waveforms

The DL750's standard memory capacity is 50 MW (2.5 MW per channel). This can be expanded (optional) to as much as 1 GW (50 MW per channel).

Benefits of GigaWord Recording

You can record data for 10 days (1 day/div) on the main screen, while displaying 1-second recordings (100 ms/div) in real time on the zoom screen. The large memory capacity lets you capture all of your data while still maintaining a sample rate fast enough to see any abnormal phenomena.

Efficient Memory Use

Sufficient memory length is available even when 16 channels are used, so you can conduct extended observations on multiple channels (2.5 MW per channel with standard memory, 50 MW per channel with maximum memory).

Multi-Channel 2-Location Zoom Function

A Wide Range of Trigger Functions for Accurately Capturing a Variety of Waveforms

Having a wide range of triggers is of course very useful for obtaining stable observations of variety of different waveforms. In addition, the GUI menu makes setting trigger conditions easy and intuitive.

Simple and Enhanced Triggers

- | | | |
|------------------------|--|--|
| SIMPLE/ENHANCED | Edge trigger: | Set a regular edge trigger |
| | A → B (N): | Triggers the n-th time that condition B goes true after condition A has gone true. |
| | A Delay B: | Triggers if condition B goes true after condition A has gone true and an interval at least equal to the delay setting has elapsed. |
| | Edge on A: | Activates an edge trigger on another input during the interval when trigger condition A is true. |
| | OR: | Triggers when any one of the individual channel conditions set with the patterns goes true. |
| | B > TIME: | Triggers when the pulse width is longer than the set time |
| | B < TIME: | Triggers when the pulse width is less than the time |
| | B TIME OUT: | Triggers when a preset time-out time is reached |
| | Period: | Triggers when a preset waveform frequency condition goes true. |
| | Window: | Triggers when a trigger source enters or leaves a level set by two points |
| Wave Window: | Triggers when a signal leaves an automatically-defined "wave window" that surrounds the waveform | |

Action-On Trigger

Automatically Save Measured Data

When this trigger is activated, the DL750 performs a specified action each time a waveform is captured and displayed on the screen. This feature is useful for saving data automatically and reliably (e.g., for data collection in automated, continuous tests).

Manual Trigger

A Trigger Can Be Activated with Press of a Button.

With this feature, a trigger can be executed whenever you like, separate from the preset trigger conditions.

Wave Window Trigger NEW

Automatically Triggers on Abnormalities in Power Supply Waveforms

This function comes standard with the DL750 to allow observation power supply waveforms. In addition to traditional power supply troubles, such as sudden outages, sags, and surges, you can make efficient real time observations of frequency fluctuations and voltage drops. This trigger activates when a signal exceeds the allowable values determined by comparing a defined waveform (wave window) with an actual waveform in real time. Comparative waveforms can be automatically produced in real time based on measured waveforms. Detection on all 16 analog channels is available (with OR conditions).

History Memory and Smart Search for Effective Access to Large Amounts of Captured Data

History Memory and History Search (Zone Search) HISTORY

Occasionally, you capture an abnormal waveform and then have it quickly disappear from the display as new data is acquired. It is not always possible to manually Start and Stop data acquisition to catch the abnormal waveform and have it displayed.

The **History Memory** function was designed for such situations. It divides long memory into a number of blocks and automatically stores up to 2000 previously captured waveforms. This means you can reliably save displayed waveforms to memory even when there are phenomena for which trigger conditions cannot be set.

The **Zone Search** function lets you define zones on the screen, and find all previously captured waveforms that either pass or don't pass through the user-defined zone. Up to four zones can be defined.

Search (Edge Search) and Zoom

The **Edge Search** counts rising and falling edges in the captured data. It automatically searches for the desired edges and displays them on a zoom screen.

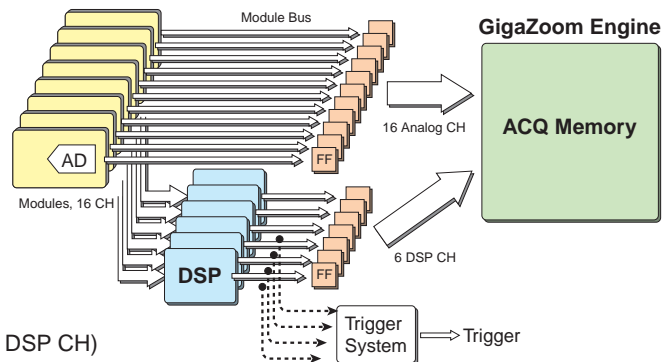

DSP Channel Real-Time Math Function (with the /G3 Option) NEW

New functions are now available with the DL750. Six digital signal processing (DSP) channels have been added. The DSP channels enable you to perform math and digital filtering in real time while acquiring waveforms. Each DSP channel can perform up to four arithmetic operations and filtering at high speed, without slowing down waveform acquisitions.

Features:

- Real-time display of calculated waveforms in roll mode
- Triggers on calculated waveforms
- Calculated parameters such as cutoff of digital filtering and frequency can be changed in real time
- Simultaneously display up to 16 channels (16 analog CH + 6 DSP CH)
- Provides the same memory length as with analog channels
- Arithmetic calculations between channels (addition, subtraction, multiplication, division), digital filtering (LPF, BFP, HPF), differentiation, and integration

Architecture of DSP-CH

Automatically Measure Waveform Parameters

Easily Find and Display Waveform Frequency, Rise Time, and Other Parameters

Waveform parameters such as voltage, frequency, and RMS are measured automatically. In addition to general parameter measurement function, the DL750 comes standard with functions such as the following:

Cycle Statistical Calculation NEW

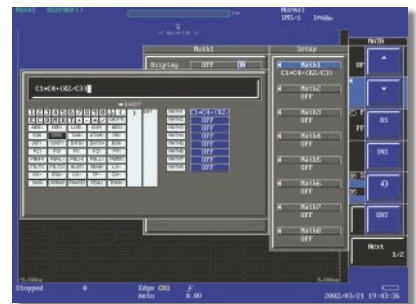

This function calculates statistical information about the waveform. Maximum value, minimum value, average value, and standard deviations are calculated automatically for each waveform parameter. In addition, you can instantaneously search for the cycle containing the maximum value and display it on the zoom screen. This cycle statistical calculation greatly improves your insight enabling you to analyze transient phenomena captured using the long recording memory.

User-Defined Math Function (with the /G2 Option)

Perform Complex Calculations

The DL750 comes standard with basic arithmetic operations (addition, subtraction, multiplication, division), FFT (power spectrum), and phase shifting (calculating a phase shift between channels). For more flexible and complex calculations, an optional user-defined math function package is available. With this option, you can define up to eight different formulas using a wide range of functions, including a triangle function, differentiation, integration, square root, digital filter, and seven different FFT functions. You can also specify the results of a calculation as a parameter in another formula. With these capabilities, the DL750 makes it easy to perform complex calculations that, in the past, could only have been done by loading data onto a PC.

Linear Scaling

Convert Measured Voltage Values to Physical Values for Direct Reading

This function automatically performs the following calculation based on a scaling coefficient A and offset B: $Y = AX + B$ (X is a measured value and Y is the scale value). The results of this calculation are reflected in cursor measurement values and waveform parameter measurement values. In addition, user-determined scale values can be defined for any two measurement, P1 and P2.

GO/NO-GO Judgment

Automatic Waveform Determinations

With this function, the user specifies a zone or waveform parameter for a measured waveform. The measurement signal is evaluated and a specified action is performed automatically based on the evaluation. Available actions include outputting a screenshot to a specified destination, saving waveform data to a specified storage medium, sounding a buzzer, and sending email.

Display and Data Recording Functions

Real-Time Hard Drive Recording (with the /C8 Option)

Recorder-Like Real-Time Data Recording over Extended Periods

With the optional internal hard drive, you can record measurements to the hard drive in real time. This makes it easier to manage and analyze data using PCs and other tools.

Maximum data capacity:
1 GW

Maximum sampling rate:
100 kS/s
(using 1 channel only)

Memory Backup Function

Protects Your Data Even If the Power Supply Goes Out

This function backs up about 10 hours of data saved to the acquisition memory immediately prior to power loss. Memory backup helps you avoid losing important data even if the power supply is unstable and gets cut off. (Backup time varies according to the usage environment. Four AA batteries are required for memory backup.)

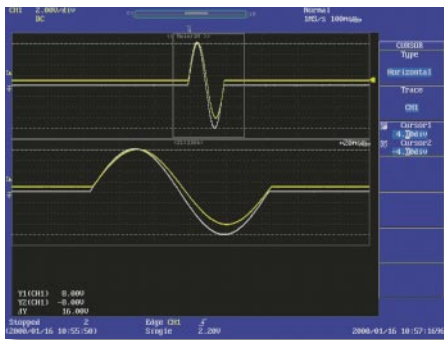

Snapshot Function

Enables On-Screen Waveform Comparisons

Using the snapshot function, you can keep the currently displayed waveform with the touch of a button. Snapshots are useful for comparing a reference waveform with an input waveform. In addition, snapshots can be saved to and loaded from the storage media.

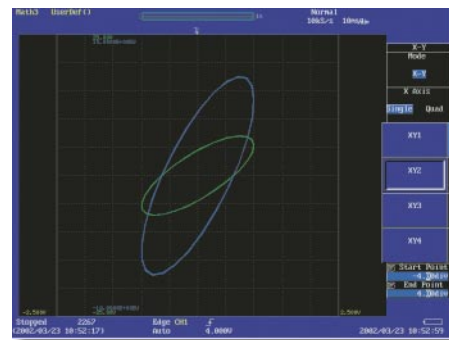

X-Y Display Function

Display an Overlay of up to Four X-Y Displays

This function lets you display multiple X-Y plots together, making relative phase comparisons easy. The X-Y display function is a powerful tool for applications such as evaluating DC motors based on a Lissajous waveform.

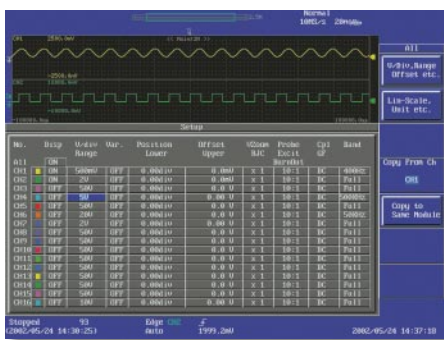

All-Channel Setup Menu

Quickly View the Setup of All Channels

This menu lets you review and modify all of the channel setups from a single screen display. Parameters such as voltage axis sensitivity, screen scale settings, and linear scaling can be configured for each channel.

Wide Waveform Display

Increase the Viewing Area of Display

With the SVGA color TFT liquid crystal display, the number of display pixels has been greatly increased. For wide waveform display, set the resolution to 750 x 512 pixels.
